

CS 499 (Fall 2006)- Assignment 11

Due: Tuesday, 12/12/2006, 6pm

This homework cannot be submitted later than the given date.

- (1) Come up with an interesting “real-world” problem relating to the content of the course, and solve it. The difficulty and amount of work should be comparable to past homeworks (i.e., this is not a huge project, nor should it be trivial). Your problem should be of some “practical” interest, at least to you. It also should either require using one or more of the algorithms you learned in class, or require solving a “new” problem using the techniques you learned in class. Obviously, you should not just take your last project for another class and resubmit it here, in the hope that it may be somewhat related. If you would like to get feedback on a problem idea, feel free to contact me.
